

due to the large amount of interference that the system will cause over the power lines i feel that this is not a good system to use. Not only will you open up your office with a large amount of interference complaints which im sure your office doesnt need the overload to your systems too. i would think that the idea of broadband internet is a good one with the exception of causing interference to the ham community, i would rather see the phone companys to be allowed to do the broadband on phones now i hook up at 49333 but only use about a 1/3 of that which im sure is limited on there system, also the movement of wi fi or putting up a systems for wireless networks is probably a better one.

you know how much interfearence a bad insulator on a edison pole causes after watching the video from the arrl and there actual tests in a given test area, wow, we would not be able to provide communications in those given areas. and i sure wouldnt want that noise in my area, some of your equipment now days have filters but there not going to stop the squeel from the data being sent down power lines, they need to find a different way to do things.
